

Why does **YOUR** salt system have a different salt reading than **OUR** water test?

NOTES: Rain and/or topping-off your water level dilutes salt readings: Allow 24 hours before getting an accurate read on salt levels

- Your salt generator shows an average reading over the last 24 hours
- Your water temperature must be at least 65 degrees for the unit to generate salt
- All salt testers have a margin of error of +/- 300ppm
- When in doubt, trust your salt system readout vs. a test from a water sample
- **If your unit is generating chlorine and does not indicate a low salt level, stay calm and carry on.**
